Predators-prey models with competition, Part I: existence, bifurcation and qualitative properties.
Communications in Contemporary Mathematics, 20(07):1850010, 2018.

The predator-prey model

- Equation for the prey:

$$\underbrace{\frac{\partial u}{\partial t}}_{\text{rate of population growth}} - \underbrace{D\Delta u}_{\text{random motion}} = \underbrace{\lambda u \left(1 - \frac{u}{K}\right)}_{\text{population growth rate}} - \underbrace{\sum_{i=1}^N p_i w_i u}_{\text{predation}}$$

Predator-prey interaction

The model

Existence of solution

The influence of the competition

Simulations in 2D: possible shapes of territories

Influence of the consumption rate

Type II functional response

Conclusion

The predator-prey model

- Equation for the prey:

$$\underbrace{\frac{\partial u}{\partial t}}_{\text{rate of population growth}} - \underbrace{D\Delta u}_{\text{random motion}} = \underbrace{\lambda u \left(1 - \frac{u}{K}\right)}_{\text{population growth rate}} - \underbrace{\sum_{i=1}^N p_i w_i u}_{\text{predation}}$$

- Equation for each predator:

$$\underbrace{\frac{\partial w_i}{\partial t}}_{\text{rate of population growth}} - \underbrace{d_i \Delta w_i}_{\text{random motion}} = \underbrace{p_i u w_i}_{\text{predation}} - \underbrace{l_i w_i}_{\text{mortality}} - \underbrace{a_{ii} w_i^2}_{\text{intraspecific competition}} - \underbrace{\beta \sum_{j \neq i} a_{ij} w_j w_i}_{\text{interspecific competition}}$$

The complete model reads

$$\left\{ \begin{array}{ll}
 \frac{\partial u}{\partial t} - D\Delta u = \left(\lambda - \frac{\lambda}{\mathcal{K}}u - \sum_{i=1}^N p_i w_i \right) u & \text{in } \Omega \times (0, +\infty), \\
 \frac{\partial w_i}{\partial t} - d_i \Delta w_i = \left(p_i u - l_i - a_{ii} w_i - \beta \sum_{j \neq i} a_{ij} w_j \right) w_i & \text{in } \Omega \times (0, +\infty), \\
 \partial_\nu u = \partial_\nu w_i = 0 & \text{on } \partial\Omega \times (0, +\infty), \\
 u(x, 0) = u_0(x) & \text{in } \Omega, \\
 w_i(x, 0) = w_{i,0}(x) & \text{in } \Omega,
 \end{array} \right. \tag{1}$$

where ν is the outward normal vector at the boundary.

Lemma [2, Lemma 2.1]:

Given a sufficiently regular initial condition $(u_0, w_{1,0}, \dots, w_{N,0}) \in C^{0,\alpha}(\bar{\Omega})$ there exists a unique global solution $(u, w_1, \dots, w_N) \in C_x^{2,\alpha} C_t^{1,\alpha/2}(\Omega \times (0, +\infty))$ of problem (1).

Moreover, the solution is bounded and, for any $\varepsilon > 0$

$$\sup_{(x,t) \in \Omega \times [T_\varepsilon, +\infty)} u(x, t) \leq \mathcal{K} + \varepsilon$$

and

$$\sup_{(x,t) \in \Omega \times [T_\varepsilon, +\infty)} w_i(x, t) \leq \frac{\mathcal{K} p_i - l_i}{a_{ij}} + \varepsilon.$$

The model

Existence of solution

Results

The influence of the competition

Simulations in 2D: possible shapes of territories

Influence of the consumption rate

Type II functional response

Conclusion

Consequence: if there exists an index $i \in \{1, \dots, N\}$ such that $\mathcal{K}p_i \leq l_i$, then

$$\sup_{x \in \Omega} w_i(x, t) \rightarrow 0,$$

as $t \rightarrow +\infty$.

Figure: Simulation that gave rise to extinction of both predators ($\mathcal{K} = 2$, $p_i = 2$ and $l_i = 4$ for $i = 1, 2$).

Simulations in 2D:
possible shapes of territories

Influence of the consumption rate

Type II functional response

Conclusion

Figure: Simulation with $p_1 = p_9 = 1.4$ and $p_i = 1$ for $i = 2, \dots, 8$. On the left we show the evolution of the density of prey and on the right the cumulative density of predators also along time.

Type II functional response model

Predator-prey interaction

The model
Existence of solution

Results

The influence of the competition

Simulations in 2D: possible shapes of territories

Influence of the consumption rate

Type II functional response

Conclusion

Handling time (T_i): the average time predator i spends on a captured prey.

The model with type II functional response:

$$\begin{cases}
 \frac{\partial u}{\partial t} - D\Delta u = \left(\lambda - \frac{\lambda}{K}u \right) u - u \sum_{i=1}^N \frac{p_i}{1 + p_i T_i u} w_i & \text{in } \Omega, \\
 \frac{\partial w_i}{\partial t} - d_i \Delta w_i = (-l_i - a_{ii} w_i) w_i + \frac{p_i}{1 + p_i T_i u} u w_i - \beta w_i \sum_{j \neq i} a_{ij} w_j & \text{in } \Omega, \\
 \partial_\nu u = \partial_\nu w_i = 0 & \text{on } \partial\Omega.
 \end{cases}$$

3 Conclusion

Predator-prey interaction

The model
Existence of solution

Results

The influence of the competition
Simulations in 2D: possible shapes of territories
Influence of the consumption rate
Type II functional response

Conclusion

- Territoriality is an emergent property of the model giving rise to a buffer zone benefiting both the populations involved.

Predator-prey interaction

The model

Existence of solution

Results

The influence of the competition

Simulations in 2D: possible shapes of territories

Influence of the consumption rate

Type II functional response

Conclusion

- Territoriality is an emergent property of the model giving rise to a buffer zone benefiting both the populations involved.
- Consumption rate of a given predator increases its territory size.

Predator-prey interaction

The model

Existence of solution

Results

The influence of the competition

Simulations in 2D: possible shapes of territories

Influence of the consumption rate

Type II functional response

Conclusion

- Territoriality is an emergent property of the model giving rise to a buffer zone benefiting both the populations involved.
- Consumption rate of a given predator increases its territory size.
- Handling time increased the prey population inside the buffer zone.

Predator-prey interaction

The model

Existence of solution

Results

The influence of the competition

Simulations in 2D: possible shapes of territories

Influence of the consumption rate

Type II functional response

Conclusion

- Territoriality is an emergent property of the model giving rise to a buffer zone benefiting both the populations involved.
- Consumption rate of a given predator increases its territory size.
- Handling time increased the prey population inside the buffer zone.
- The territory size decreases with an increase in the handling time until it reaches a rupture point and the predator becomes extinct.
